

## **The Solar System Song** *by Zoya Ansari*

There is a great big ball of gas, in which we call the Su-un,  
made up of some hydrogen and some heliu-um!

The inner planets made of rock, the outer made of gases, but  
to make a revolution the inners are the fastest!

A natural satellite is just something like a mo-on, too bad  
Mercury and Venus won't have one too soo-on!

An asteroid circles the Sun, inside the asteroid belt, if it hits  
something else, of course it would be fe-elt!

A comet is a mixture of some ice, dust, and ro-ock,  
they don't come too often to our doors to kno-ock!

A meteor is something that enters Earth's atmosphere, by the  
way it looks like a really big sphere!

Gravity is the force that keeps things down, without it we  
wouldn't be touching the grou-ound!

Inertia is the thing that keeps things moving, without it we  
would be pulled into the Sun and then we would be  
scorching!

That's the Solar System Song, to remember all of this, now  
any science test will just feel like bli-iss!
